

# Inverse design of a symmetric bimodal fitness landscape

Target has 2 equal peaks; the best-fit model reaches only 1 — the two-peak landscape is not reachable by tuning the environment alone.

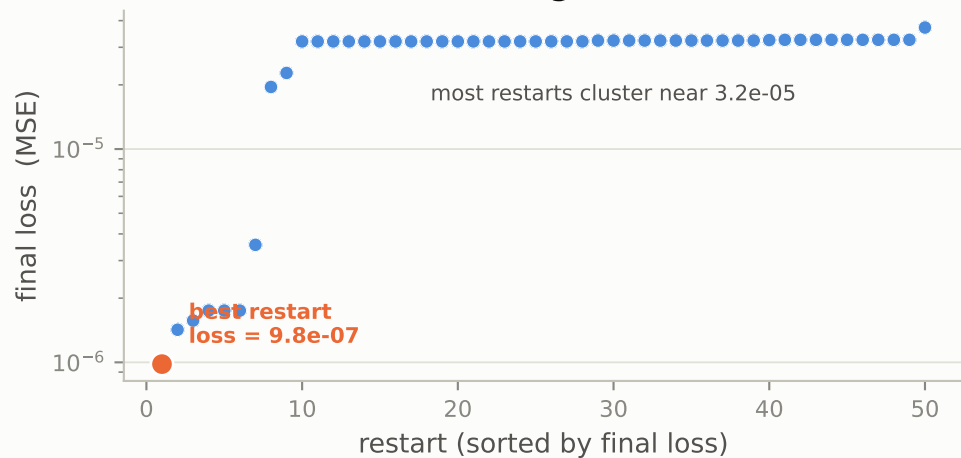

## A Symmetric bimodal target vs. best-fit model landscape

## B Where the fit breaks down (RMS residual = 8.96e-04)

## C 50 restarts all converge, most to the same basin

## D Recovered environments scatter across the whole prior
